

Dispatch model gap

D3D/Vulkan have native SBT dispatch for pipeline stages. Metal has traversal dispatch for custom intersection functions, but miss and closest-hit are ordinary post-trace shader logic.

D3D / Vulkan: driver or hardware dispatches through SBT records

gap: closest-hit dispatch changes ownership

D3D/Vulkan: host SBT records. Metal: user-specified shader code.

Metal: users write miss and closest-hit dispatch after intersect()
